

Battle Building at UVA Children's Hospital: *A Bridge from Hospital to Home*

When Bethany was just three months old, a stroke left her with a weakened right arm. As part of her rehabilitation at UVA Children's Hospital, she participated in a clinical trial called "constraint induced therapy," where a team of specialists put four-year-old Bethany's strong arm in a cast to encourage use of her weak arm.

Bethany was lucky to participate in innovative clinical trials and receive expert care. The Battle Building at UVA Children's Hospital, a new comprehensive outpatient facility, will give more children like Bethany access to a wide range of care in a place intertwined with miracles of healing. With open arms, children will gain access to all types of physical and occupational therapy.

That's why we have conceived the new Battle Building with a child's eye in mind, filling the new building with bright, beautiful spaces designed for entire families and the delivery of key features. Among them:

- Outpatient and rehabilitative care in a friendly space, making care more convenient and collaborative
- Clinics in primary care, cancer, autism, heart disease, diabetes, and other specialties
- An on-site pediatric infusion center
- A direct link to the UVA Children's Hospital inpatient units, with convenient pick-up and drop-off locations and nearby parking designed for ease of movement

"I have met many families who credit UVA Children's Hospital with saving their children's lives," says Barry Battle, long-time UVA Children's Hospital advocate and benefactor. "This special new building will provide a tremendous resource to our community."

Construction is currently underway, but private support is still needed to complete the project. For more information or to make a gift, please call (800) 297-0102 or (434) 924-8432. Or visit <http://uvachildrens.org>.
